                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Direct Submission

Li Submitted (09-FEB-2000) Plant Gene Expression Center, 800 Buchanan Street, Albany, CA 94710, USA
On Feb 11, 2000 this sequence version replaced gi:6693723.
The sequence is of BAC F1407 from Arabidopsis thaliana chromosome
1. The sequence does not represent the sequence of the entire
insert of this clone. It is shorter by 6954 bp because we submit conly the unique sequence of the clone. However, in order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide small overlaps (200 bp) between overlapping sumbitted clones. The 5' end of this sequence overlaps by 200 bp to the 3' end of the sequence of the clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     caatccc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CTATTCTTTATCTTTACGAGAACTATTTAACTGGTGTCATTCCCCCGGAACTAGGCAACA 2645

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genes were identified by a combination of three methods: Gene prediction programs including GRAII (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/~chris/CENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of expons to Genes that are not annotated as genes but have predicted expons by GRAII.are annotated as misc, features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rockville, MD 20850, USA

BAC clone FIM20 is from Arabidopsis chromosome I and is near the
molecular marker mi425.
The orientation of the sequence is from SP6 to T7 end of the BAC

Production of apomictic seeds - useful in plant breeding Claim 28; Pages 71-73; 123pp; English.

The sequence is that of an EST clone showing high homolog SERK LRR (leucine-rich repeat) sequences.
                                                                                                                                                                                                                                     1021

Production of apomictic seeds - useful in plant breed Claim 28; Pages 75-77; 123pp; English.

The sequence is that of an EST clone showing high hom SERK LRR (leucine-rich repeat) sequences.

Sequence 981 BP; 286 A; 236 C; 180 G; 2

Production of apomictic seeds - useful in plant breed Claim 28; Pages 83-64; 123pp; English.
The sequence is that of an EST clone showing high hom SERK LRR (leucine-rich repeat) sequences.
Sequence 894 BP; 270 A; 163 C; 176 G;
                                                                                                                     Arabidopsis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

Seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase.
It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (NOVS) NOVARTIS AG.

Production of apomictic seeds - useful in plant breeding Production of apomictic seeds.

Claim 21; Pages 47-51; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed appropagated hybrids and could shorten and simplify the breeding programs that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to yie a plant with, e.g. short stems or altered inflorescence. The MRF acts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP; scDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.

Claim 9; Page 85-87; 131p; English.

T06307 is a tomato pathogen resistance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum. C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

Claim 9; Page 80-83; 131pp; English.

T06306 is the tomato pathogen resistance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulrum.

C. fulrum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

                                                                                                                                                                                                                                                                                         Š
                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                            plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant to reeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed apomictic plant and could shorten and simplify the breeding propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

Seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing
                                                                                                                                                                                                                                                                   1794

Production of apomictic seeds - useful in plant breeding Production of apomictic seeds - useful in plant breeding Scalaim 21; Pages 40-46; 123pp; English.

Claim 21; Pages 40-46; 123pp; English.

Critically be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides breeding programs. Controllable and reproducible apomixis provides breeding programs. Apomixis provides for true-breeding, seed apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cladosporium fulvum-5. Transgenic plants can be produced by incorporating the gene into plant cells and regenerating plants from the cells; asexually or sexually produced offspring can also be subsequently produced. Expression of the gene in plant cells can confer pathogen resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. Oligonucleotides with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and cf-9 may be used to identify further resistance genes of this class. Sequence 3979 BP; 1217 A; 717 C; 698 G; 1347 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-MAY-1996; GB-019924.

In Tomato gene CG-5, confers resistance to Cladosporium fulvum - useful production of transgenic plants resistant to pathogens e.g. for production of transgenic plants resistant to pathogens e.g. to the production of transgenic plants resistant to pathogens e.g. Claim 6; Fig 1b; 75pp; English.

Produced is an example of the polynucleotide of the invention, and confer pathogen resistance on a plant. It is one of two tomato CC This sequence is an example of the polynucleotide of the pathogen cC CF-5 gene variants, which offer resistance against the pathogen cC Cladosporium fulvum-5. Transgenic plants can be produced by incorporating the gene into plant cells and regenerating plants from the cells; cC asexually or example produced offspring can also be subsequently concluded. Expression of the gene in plant cells can confer pathogen cresistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. CO ligonucleotides with sequences complementary to the gene or fragments conference actions probes to identify other genes/fragments conference as hybridisation probes to identify other genes/fragments conference as hybridisation probes to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CF-5 pathogen resistance gene variant #2.
Tomato; CF-5 pathogen resistance gene; Cladd tomato leaf mould; Phytophthora resistance;
Lycopersicon pimpinellifolium.
